| Sky Link, a telecommunications company with multiple legal entities, faced challenges in unifying its accounting and inventory management systems. The lack of an integrated system led to disparate data, difficulties in generating consolidated reports, and hindered integration with other internal planning systems, thereby reducing overall operational efficiency and transparency. | In my dual role as Business Analyst and Project Manager, my task was to deploy and configure an integrated accounting system (1C: Accounting + Trade & Warehouse). The goal was to unify accounting and inventory management across all company legal entities, ensure transparent reporting, and facilitate integration with existing planning systems. | <p>Analysed Current Processes: Conducted a detailed analysis of the existing accounting and warehouse management processes across all legal entities of the company. Gathered and Analysed Requirements: Collaborated with key stakeholders (accounting, logistics, management) to collect and formalise requirements for the new integrated system.</p> <p>Designed and Configured the System: Developed the functional specification and oversaw the configuration of the 1C: Accounting and 1C: Trade & Warehouse systems in accordance with the identified requirements and specificities of all legal entities.</p> <p>Managed Projects and Teams: As a Project Manager, I was responsible for planning, coordinating, and controlling all phases of the project, including development, testing, data migration, and implementation. I led the team, ensuring adherence to timelines and quality standards.</p> <p>Unified Data and Processes: Worked on unifying accounting policies and procedures across all legal entities to ensure data consistency in the new system.</p> <p>Integration: Planned and oversaw the integration efforts of the new system with the company's existing planning systems.</p> <p>Training and Support: Organised user training for the new system and provided necessary support during the implementation phase.</p> | <p>An Integrated Accounting System was Implemented: The 1C: Accounting + Trade & Warehouse system was successfully deployed and configured, allowing for centralised management of accounting and inventory.</p> <p>Accounting and Inventory Management were Unified: The complete unification of accounting and inventory across all company legal entities was achieved.</p> <p>Transparent Reporting was Enabled: The company gained the ability to generate unified, transparent, and consolidated financial and inventory reports.</p> <p>Integration with Planning Systems Achieved: The new system was successfully integrated with existing planning systems, resulting in improved forecasting accuracy and informed decision-making.</p> <p>Operational Efficiency Increased: Process optimisation and task automation led to an overall increase in the efficiency of financial and warehouse operations.</p> |
